

COMPANY PORTFOLIO

Project delivery leadership and management oversight

AXIS Utility Group provides construction management, health and safety oversight, quality assurance and handover expertise for solar, battery storage and substation projects, driving safe, compliant and successful delivery.

Focused on successful project delivery

We lead construction coordination, align contractors around programme priorities and maintain management oversight of safety, quality and progress. Our approach brings clear direction, accountable actions and the information needed to move from construction towards commissioning and handover.

Sector	Leadership and management scope
Solar PV	Construction leadership, contractor coordination, quality oversight and commissioning interfaces.
Battery storage	Delivery oversight across construction, commissioning coordination and specialist interfaces.
Substations and utility civils	Civil and electrical work-front coordination, management reporting, inspections and completion planning.

Four core services

- Construction management: delivery leadership, work sequencing, contractor interfaces, logistics and progress reporting
- Health and safety oversight: inspections, work-control reviews, briefings and action follow-up
- Quality assurance: inspection planning, traceability and management of outstanding quality actions
- Handover expertise: readiness reviews, completion planning and coordination of the evidence required

These summaries describe project leadership and management experience gained by AXIS team members through individual appointments, including work undertaken before AXIS was established.

SERVICE DELIVERY

Management that drives delivery

We take responsibility for the agreed management scope, with defined deliverables, reporting and escalation routes. The appointment establishes the project stage, decision responsibilities, required attendance and the outputs needed by the client.

Service	Example management outputs
Construction management	Daily or weekly progress reports; short-term lookahead programmes; contractor interface and constraint registers.
Health and safety oversight	Inspection and observation records; prioritised action trackers; management summaries and escalation records.
Quality assurance	Inspection and test plan trackers; quality record reviews; defect and non-conformance registers.
Handover expertise	Handover matrices; testing prerequisite trackers; document status registers and completion summaries.

Clear direction, reporting and follow-through

The agreed delivery pack brings together the management scope, baseline assessment, action and risk registers, review records, quality and handover status, progress reporting and a final close-out report. Each output is proportionate to the work and the decisions the project team needs to make.

Focused reviews and recovery support

Where a project needs additional management input, AXIS can assess the work, programme interfaces, available information and outstanding decisions. The review defines the next actions, owners, evidence requirements and escalation routes. Corrective work follows the appropriate design, specialist and client decision process.

Defined responsibility

Specialist design, temporary-works appointments, electrical operations, testing authority and formal acceptance are defined separately. Personnel must hold the competence and authorisation required for their appointment.

PROJECT LEADERSHIP EXPERIENCE

Solar PV construction leadership

Construction leadership and management oversight across utility-scale solar work fronts. The management scope brought together contractor coordination, work sequencing, progress reporting, quality inspections and the interfaces with commissioning and witness activity.

Leadership and management oversight

Management responsibilities included leading day-to-day contractor coordination and maintaining oversight of work sequencing, logistics, progress and site inspections. This work connected construction activity with commissioning preparation and kept project stakeholders informed of constraints, priorities and required decisions.

- Coordinated subcontractors, civil and electrical work fronts, logistics and materials
- Monitored construction progress against project requirements and reported priorities
- Carried out inspections and checked work against drawings, specifications and inspection requirements
- Coordinated construction interfaces and supported commissioning and witness coordination

Our approach to successful delivery

This experience informs the way AXIS leads construction activity, coordinates interfaces and maintains management visibility of progress, quality and readiness. We apply that approach within an agreed project delivery scope.

Typical outputs for a new commission

- Construction progress reports and short-term lookahead programmes
- Contractor interface, constraint and action registers
- Inspection status and commissioning prerequisite trackers

Example outputs are agreed for each new appointment. These summaries describe project leadership and management experience gained by AXIS team members through individual appointments, including work undertaken before AXIS was established.

PROJECT LEADERSHIP EXPERIENCE

Battery storage delivery oversight

Management oversight of battery storage activity during commissioning and testing, with wider construction coordination experience. Responsibilities covered contractor and specialist interfaces, safety and quality oversight, progress reporting and the management of outstanding actions.

Leadership and management oversight

Management responsibilities included coordinating site activity and specialist interfaces around commissioning priorities and access requirements. The scope also covered oversight of safety, quality, progress and outstanding matters, connecting battery, electrical and control-system activity with completion information.

- Coordinated contractors and specialist teams around commissioning activity and access
- Managed coordination across battery, electrical and control-system interfaces
- Maintained safety and quality oversight and reported progress to stakeholders
- Tracked outstanding actions and organised commissioning and completion information

Our approach to successful delivery

AXIS applies this experience to commissioning coordination, readiness tracking and clear ownership of outstanding actions. Electrical switching, specialist testing, certification and commissioning authority remain with appropriately appointed parties.

Typical outputs for a new commission

- Commissioning prerequisite and action registers
- Coordination meeting records and management status reports
- Test document indexes and handover evidence trackers

Example outputs are agreed for each new appointment. These summaries describe project leadership and management experience gained by AXIS team members through individual appointments, including work undertaken before AXIS was established.

PROJECT LEADERSHIP EXPERIENCE

Substation construction leadership

Construction leadership and management oversight across civil and electrical work fronts. The management scope included contractor coordination, work-pack reviews, site briefings and reporting on programme, resources, safety and quality.

Leadership and management oversight

Management responsibilities included leading day-to-day construction coordination, site briefings and progress meetings. The scope also covered oversight of contractor interfaces, work-pack information, inspections and upcoming activities, with reporting on programme, resources, safety, quality and decisions requiring stakeholder input.

- Coordinated concurrent civil and electrical work fronts and contractor interfaces
- Reviewed work packs, risk assessments, method statements and inspection requirements within the appointment
- Led site briefings, coordination meetings and progress reporting
- Coordinated construction-to-commissioning interfaces and completion information

Our approach to successful delivery

This experience informs the construction leadership and client representation services provided by AXIS, with visible responsibility for work fronts, timely escalation and a clear management record. The individual appointment concluded; wider project completion and formal acceptance are separate matters.

Typical outputs for a new commission

- Work-front, contractor interface and action registers
- Daily or weekly construction management reports
- Quality and completion status reviews

Example outputs are agreed for each new appointment. These summaries describe project leadership and management experience gained by AXIS team members through individual appointments, including work undertaken before AXIS was established.

PROJECT LEADERSHIP EXPERIENCE

Utility civils delivery coordination

Collective management and coordination experience across enabling works, drainage, ducting, concrete, foundations, access and reinstatement. Responsibilities span work sequencing, plant and materials, contractor interfaces, inspection planning and completion records across separate appointments.

Construction coordination and delivery oversight

- Coordinated utility enabling works, civil work fronts and installation records across separate appointments
- Managed work sequencing, plant and materials coordination, with quantities and procurement support
- Coordinated the interfaces between civil work, cable installation and specialist electrical or fibre activities
- Planned inspections and brought together drawings, installation records and handover information

Practical knowledge of the work

Collective experience spans groundworks, drainage, ducting, concrete and formwork, equipment foundations, access roads and reinstatement. Earlier experience in enabling works and vegetation management adds an understanding of access, ecological constraints, public segregation and delivery logistics.

Our approach to successful delivery

AXIS connects work-package priorities with contractor responsibilities, inspection requirements and completion information. This gives the client a structured way to review progress, identify missing records and assign responsibility for the decisions and actions needed for the next stage.

Typical outputs for a new commission

- Civil package and interface reviews
- Inspection and evidence responsibility matrices
- Prioritised completion plans and document status registers

These activities reflect collective experience across separate appointments. These summaries describe project leadership and management experience gained by AXIS team members through individual appointments, including work undertaken before AXIS was established.

ENGAGING AXIS

A clear route from brief to handover

We work with principal contractors, independent connection providers, engineering and construction delivery teams, developers and asset owners. Appointments can provide embedded construction leadership, periodic management oversight or a defined assurance and handover package.

Stage	What we agree or provide
Understand the brief	Confirm the sector, project stage, priorities, available information and required start date.
Define the scope	Agree management responsibilities, outputs, attendance, reporting and commercial terms.
Mobilise and assess	Review the work and records, establish the baseline and confirm action owners.
Lead, coordinate and report	Coordinate the agreed delivery scope, track progress and evidence, and escalate decisions.
Close the appointment	Issue the completion record, evidence index, outstanding actions and recommendations.

Project information and the AXIS portal

Our management approach uses structured registers and evidence indexes. Where included in the appointment, the AXIS portal supports the agreed project information workflow. The scope defines access, reporting and the arrangements for issuing and retaining records.

Flexible management engagement

Engage AXIS for construction management, delivery oversight, a focused assurance review or a quality and handover package. A 30- or 90-day review period can be scoped where appropriate, with attendance, professional time and outputs agreed individually.

Discuss your project

Tell us your sector, project stage, required management input and anticipated start date. A general description is sufficient for the first conversation.
